Effect Size

Efficacy & time-to-effect

Treatment phase

	Group 1: 2-compound scalp formulation of calcipotriol + betamethasone	Group 2: Calcipotriol scalp solution	Odds ratio (CI), p value
Proportion of patients with ‘clear’ or ‘minimal’ disease according to IGA at week 2	125/207 (60.4%)	11/105 (10.5%)	-
Proportion of patients with ‘clear’ or ‘minimal’ disease according to IGA at week 4	114/207 (55.1%)	19/105 (18.1%)	-
Proportion of patients with ‘clear’ or ‘minimal’ disease according to IGA at week 8 (primary endpoint)	142/207 (68.6%)	33/105 (31.4%)	OR 5.4, 95% CI 3.1 to 9.4;p<0.001
Proportion of patients with ‘clear’ or ‘very mild	170/207 (82.1%)	36/105 (34.3%)	OR 9.4, 95% CI 4.3 to 20.3;p<0.001

disease according to patient's assessment at week 8			
Withdrawals due to AE in treatment phase	2/207 (1.0%)	9/105 (8.6%)	
Skin atrophy	0/207	0/105	
Compliance (missed \leq 10% of applications)	170/206 (82.5%)	82/102 (80.4%)	<i>Note: compliance data not available for all patients</i>

Time to maximum effect (based on mean TSS):

- Mean TSS plateaux after 2 wks for calcipotriol vs 4 wks for two-compound formulation
- Over the first 2 weeks of treatment , the mean TSS for the two compound formulation decreased more rapidly than for the calcipotriol scalp solution and remained below that of the calcipotriol scalp solution throughout the treatment period to week 8

Observation phase

	Group 1: 2-compound scalp formulation	Group 2: Calcipotriol scalp solution	Odds ratio (CI), p value
Relapse:			Not calculated (groups not randomised; far fewer entered from group 2)
number of patients	73/135 (54.1%)	10/29 (34.5%)	
median time to relapse	35 days	58 days	
meeting criteria for rebound	2 (1.5%)	0	

Authors conclusion

- Once daily 2-compound scalp formulation of calcipotriol + betamethasone significantly more effective than twice daily calcipotriol scalp solution with fewer adverse effects and a low rate of withdrawals for patients with moderate to severe scalp psoriasis, although it is not a cure and relapse may be expected.

Authors' conclusion

The two-compound calcipotriene / betamethasone dipropionate scalp formulation was safe and effective in the treatment of scalp psoriasis in Hispanic/Latino and Black/ African American patients.

% clear or nearly clear at wk 4 on PAGI	36 (47.3%)	23 (31.1%)	0.009

Time to effect

- Graphical representation of mean TSS over time shows that clobetasol propionate acts more quickly, with a large effect by week 2 which begins to slow between weeks 2-4. Calcipotriol has a more constant reduction in mean TSS, which has not reached a plateau by the end of the trial (4 weeks)

Withdrawals

	Clobetasol propionate N = 76	Calcipotriol N = 75
Withdrawal due to adverse events	0	7

Adverse events

Skin atrophy, n (%)	Clobetasol propionate	Calcipotriol

Baseline	N = 76	N = 75
Edge of scalp	3 (3.9%)	0
Face	5 (6.6%)	0
Neck	1 (1.3%)	2 (2.7%)
Week 4 *	N = 74	N = 64
Edge of scalp	1 (1.4%)	0
Face	4 (5.4%)	0
Neck	1 (1.4%)	1 (1.6%)

Authors conclusion

- Short contact therapy of scalp psoriasis with this new shampoo formulation of clobetasol propionate was significantly more effective and better tolerated than calcipotriol solution for the treatment of scalp psoriasis.

	<p>Calcipotriol (n = 236)</p>	<p>Betamethasone (n = 232)</p>	<p>95% CI of difference</p>	<p>P value</p>				
<p>Investigator global assessment at week 4 'marked improvement or cleared'</p>	<p>138 (58.5%)</p>	<p>175 (75.4%)</p>	<p>25.3 – 8.6</p>	<p><0.001</p>				

Patient global assessment at week 4 'marked improvement or cleared'	136 (57.6%)	171 (73.7%)	24.6 – 7.6	<0.001
Time to effect				
Score for extent and total sign score decreased significantly from baseline at week one (and all subsequent time points) for both treatment groups (displayed graphically).				
Time to max effect				
TSS had not reached a minimum for either treatment group at week 4				
Compliance				
Compliance was good in both groups and >90% of patients were fully compliant at each follow-up visit. Patients used a mean of 31.5 (±16.9) ml per week in the calcipotriol group and 27.1 (±17.5) ml per week in the betamethasone group (p = 0.014)				
Toxicity				
Prematurely discontinued treatment				
	Calcipotriol (n = 240)	Betamethasone (n = 234)		
Adverse event s	11 (4.6%)	2 (0.85%)		
Unacceptable treatment response	4 (1.7%)	2 (0.85%)		
Default	5 (2.1%)	5 (2.1%)		

Adverse events

	Calcipotriol (n = 240) No. of adverse events (%)	Betamethasone (n = 234) No. of adverse events (%)	P
Lesional or perilesional irritation	62 (25.8)	19 (8.1)	<0.001
Facial irritation	27 (11.3)	1 (0.4)	<0.001
Various skin reactions	6 (2.5)	9 (3.08)	NS
Non-cutaneous	3 (1.2)	6 (2.5)	NS
No. of patients reporting ≥1 adverse event	87 (36.3)	31 (13.2)	<0.001

There were no consistent or clinically important differences between the calcipotriol- and betamethasone-treated groups with regard to haemopoietic, liver or renal function. In particular there was no change in the mean serum total calcium in either group during the double-blind treatment.

Post treatment follow-up and re-treatment

	Calcipotriol (n = 99)	Betamethasone (n = 129)	95% CI of difference	P value
Relapse rate after 4 weeks observation (defined as an increase in the total sign score to at least 50% of the score at the start of double-blind treatment)	75 (75.8%)	102 (79.1%)		NS
Received retreatment with calcipotriol for 6 weeks	n = 69			
Patient global assessment at end of retreatment	82.6%			

'marked improvement or cleared'				
TSS Mean % reduction in score from relapse to end of retreatment	60.1%		51.8 – 68.4	<0.001

There was no change in serum calcium during retreatment

Summary

- Calcipotriol solution was effective in treating mild to moderate scalp psoriasis. However, betamethasone solution was significantly more effective, and was associated with statistically significantly less local irritation on the scalp and face

Caucasian	98.3%	98.3%																				
<p>Effect Size Outcomes Efficacy (available case analysis)</p>																						

0-8 weeks	Calcipotriol (n=210)	Coal Tar (n=213)	OR (95% CI)	p-value
IAGI (at least moderate improvement) (6 pt: worse to cleared)	120 (57%)	79 (37%)	3.2 (2.0-5.2)	<0.001

- N = 166 Calcipotriol-treated patients, who had shown at least slight improvement entered the long-term treatment phase. For these patients, the mean change in TSS from baseline to 8 weeks was -2.2 and week 8 to 24 was -1.0. p<0.05 16 versus 8 weeks.

Time to effect

- During the 8 wk comparative phase graphical information shows that based on change in TSS both treatments had not reached maximum effect by the end of 8 weeks
- Over the long-term treatment phase graphical information shows that based on change in TSS calcipotriol reaches maximal effect by 12 weeks, with only slight further improvement up to 24 wks (<0.5 point reduction on TSS over 12 weeks)

Toxicity

	Calcipotriol (8wks) N=230 (during comparative treatment)	Coal Tar N=215 (during comparative treatment)	Calcipotriol (16wks) N=166 (long-term treatment)
Withdrawal due to adverse events	35 (15.2%)	16 (7.4%)	6 (3.6%)

Summary

- Calcipotriol scalp solution is more effective than a coal tar-based shampoo and shows continued efficacy and good tolerability with long-term use.

Time to effect

Tacrolimus ointment was associated with significant improvements on the PGA and SSS at day 8 (first evaluation after baseline) in 24.8% compared with 6% in vehicle group.

	Tacrolimus ointment (n = 112)	Vehicle (n = 55)	P value
PGA Clinical improvement \geq 90% (excellent improvement or clearing) at day 8	24.8%	6%	= 0.004
SSS	Not stated	Not stated	= 0.001

Time to max effect

Percentage of patients with rating of 'excellent improvement' or 'clearing' for PGA was highest for both vehicle and tacrolimus ointment at day 57

(displayed graphically); although there was only modest improvement (<5% increase in numbers achieving success) from day 29.

Toxicity

Prematurely discontinued treatment

	Tacrolimus ointment (n = 112)	Vehicle (n = 55)
Adverse event – treated area	0	0
Adverse event – non-treated area	0	1 (1.8%)
Lack of efficacy	0	6 (10.9%)
Lost to follow-up	7 (6.3%)	4 (7.3%)
Other*	7 (6.3%)	5 (9.1%)

*Other reasons include patient decision, non-compliance and ineligibility

Incidence rate of reported or observed drug-related adverse events occurring in >2% of the study population

	Tacrolimus ointment (n = 112)	Vehicle (n = 55)	P value
Burning or stinging	9 (8.0%)	4 (7.3%)	1.00
Hyperesthesia	5 (4.5%)	0	0.17
Itching	8 (7.1%)	1 (1.8%)	0.27

These three adverse events occurred on average within the first three days of treatment for both treatment groups, excluding burning/stinging in the tacrolimus ointment-treated group, which had a mean time to onset of 10 days.

There were no reports of cutaneous infections or systemic adverse events

Authors conclusion

- Tacrolimus ointment (0.1%) is an effective treatment for psoriasis of the face or intertriginous areas

H.7.7 TACROLIMUS VS VITAMIN D OR VITAMIN D ANALOGUE

Effect Size

Outcomes

Efficacy

For each sign of psoriasis (scaling, plaque thickness, erythema), patients in the BMV foam group demonstrated significantly greater improvement after 28 days of treatment than did patients in the BMV lotion, placebo lotion or placebo foam groups (displayed graphically). The same trend was seen in the pruritus score, though the difference between BMV foam and BMV lotion was not statistically significant (displayed graphically)

% of patients completely clear or almost clear of disease at the end of treatment	BMV foam (n = 57)	BMV lotion (n = 58)	Placebo foam (n = 28)	Placebo lotion (n = 29)
IAGI	41 (72%*†)	27 (47%§)	6 (21%)	6 (21%)
PAGI	44 (77%*†)	27 (47%§)	6 (21%)	4 (14%)

*BMV foam vs placebo foam: $p < 0.05$

†BMV foam vs BMV lotion: $p < 0.05$

§BMV lotion vs placebo lotion: $p < 0.05$

Time to max effect

Maximum effect was not reached for scaling, plaque thickness, pruritus and erythema scores by 28 days for all treatment groups (displayed graphically), with exception of placebo foam which was reached after 15 days for the scaling score.

Toxicity

No patients discontinued treatment during the study due to local skin reactions

Drug related complaints were burning, stinging, or itching at the site of application. Majority of these reactions were classified as mild. By the end of the treatment period, reports of local reactions at the site of application had diminished in both active treatment groups relative to the placebo groups. No patient discontinued treatment during the study due to local skin reactions.

Summary

- BMV foam was associated with significantly greater improvement after 28 days of treatment for scaling, erythema and plaque thickness scores of psoriasis compared to BMV lotion, placebo lotion or placebo foam

Authors' conclusion

The regimen of Clobetasol propionate shampoo 0.05% once daily for initial treatment phase (4 weeks) and relapses (for 4 weeks) and twice-weekly (3 days apart) in long-term remission/ maintenance is efficacious and safe for long-term control of moderate scalp psoriasis.

Effect Size

Outcomes

Efficacy

	Clobetasol propionate shampoo (n = 95)	Vehicle shampoo (n = 47)	P value
Proportion of patients achieving 'success' (GSS clear or minimal) at 4 weeks	40 (42.1%)	1 (2.1%)	<0.001
Proportion of patients achieving 'success' (GSS clear or minimal) at 6 weeks	Significantly more patients in clobetasol propionate shampoo arm achieved 'success' compared to vehicle arm (no further details)		=0.003

- About 50% of subjects in the clobetasol propionate shampoo arm who achieved success at week 4 remained a treatment 'success' at the 2 week

follow-up

- There was no observation of rebound, defined as having achieved ‘success’ during treatment and then deteriorated to worse than pre-treatment levels.

	Clobetasol propionate shampoo (n = 95)	Vehicle shampoo (n = 47)	P value
GSS at 4 weeks – Proportion mild or better	68 (71.6%)	7 (14.9%)	<0.001
GSS at 4 weeks – Proportion clear	10 (10.5%)	0	<0.001
Investigator assessment at 4 weeks	Significantly better with clobetasol propionate shampoo compared to vehicle (depicted graphically)		<0.001
Subject assessment at 4 weeks	Significantly better with clobetasol propionate shampoo compared to vehicle (depicted graphically)		<0.001

Time to effect

Score for TSS decreased significantly from baseline at week two (first evaluation after baseline) for clobetasol propionate shampoo subjects compared to vehicle control (displayed graphically).

Time to max effect

Score for TSS was most reduced for both treatment groups at week 4 (displayed graphically).

Toxicity

	clobetasol propionate shampoo (n = 94)	vehicle (n = 47)	
--	--	------------------	--

Proportion of patients with ≥1 study drug related AE	13 (13.8%)	10 (21.3%)	
Skin discomfort which included stinging and burning (this was the most frequently reported dermatologic AE)	10.6%	17%	
<ul style="list-style-type: none"> • One subject treated with clobetasol propionate shampoo reported conjunctivitis, resolving in one day, not requiring treatment and not causing the patient to discontinue the study • No case of skin atrophy, telangiectasia, acne, serious adverse events or deaths were reported during the study 			
Summary			
<ul style="list-style-type: none"> • Results after 4 weeks demonstrated that clobetasol propionate shampoo, 0.05% was with a similar safety profile significantly more effective than its vehicle
